

Ecobond Phased Road development –Manzini Municipality

A previously existing bitumen surfaced road had been used past its design life and due to budget issues was converted back to a gravel road. As the municipality did not have budget to stabilize and asphalt the road at the same time a phased approach was taken.

A 150mm layer was stabilized using Ecobond EBase at 1.5% binder content with a view to use it as a temporary wearing course and 9 months later become a base course under 30mm of hot mix asphalt.
