

BituForce has been certified by the Board of Agrement South Africa. It has been certified for the stabilization of Crushed stone, Natural gravel and sands (It is not recommended for stabilizing clay material) as a Bitumen Stabilized Material (BSM) according to TG2 (2009) on all roads classes. (It can also be designed using the Wirtgen Cold Recycling Manual).

Independent tests have shown double the 24hour soaked strength when compared to the standard methods.

This means that the design engineer can make his road stronger for the same price, or alternatively, get the same strength at a lower price.

(BituForce is never mixed with cement or lime).
